PRACTICAL FILE

OF

DEEP LEARNING

AT

BABA BANDA SINGH BAHADUR ENGINEERING COLLEGE

SUBMITTED IN PARTIAL FULFILLMENT OF THE REQUIREMENT FOR THE AWARD OF THE DEGREE OF

BACHELOR OF TECHNOLOGY

(Computer Science & Engineering)

SUBMITTED BY:

PRINCE KUMAR (2001308)

SUBMITTED TO:

Pro. Mehzabeen Kaur

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

BABA BANDA SINGH BAHADUR ENGINEERING COLLEGE,

FATEHGARH SAHIB

PRACTICAL NO. :- 1

AIM : Creating a basic network and analyze its performance.

INPUT

```
#import python libraries required:

from keras.models import Sequential
from keras.layers import Dense , Activation
import numpy as np

#use numpy arrays to store inputs(x) and outputs(y):

x=np.array([[2,2],[2,4],[2,5],[4,5], [4,8], [4,6]])
y=np.array([[2],[2],[4],[5], [6], [8]])

#define the network model and its arguments

#set the number of neurons/nodes for each layer:

model = Sequential()
model.add(Dense(4, input_shape=(2,)))
model.add(Activation('linear'))
model.add(Dense(2))
model.add(Activation('linear'))

#compile the model and calculate its accuracy

model.compile(loss='mean_squared_error', optimizer='sgd', metrics=['accuracy'])

#print a summay of the Keras model:

model.summary()
```

OUTPUT

```
Model: "sequential"
_________________________________________________________________
 Layer (type)                Output Shape              Param #
=================================================================
 dense (Dense)               (None, 4)                 12

 activation (Activation)     (None, 4)                 0

 dense_1 (Dense)             (None, 2)                 10

 activation_1 (Activation)   (None, 2)                 0

=================================================================
Total params: 22 (88.00 Byte)
Trainable params: 22 (88.00 Byte)
Non-trainable params: 0 (0.00 Byte)
_________________________________________________________________
```

PRACTICAL NO. :- 2

AIM : Deploy the Confusion Matrix and simulate for Overfitting.

INPUT

```
# Deploy the Confusion matrix and simulate for Overfitting
import numpy as np
import tensorflow as tf
from tensorflow import keras
from sklearn.datasets import load_iris
from sklearn.model_selection import train_test_split
from sklearn.metrics import confusion_matrix
import matplotlib.pyplot as plt

# Load the Iris dataset
iris = load_iris()
X, y = iris.data, iris.target

# Split the data into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)

# Create a simple feedforward neural network
model = keras.Sequential([
    keras.layers.Dense(64, activation='relu', input_dim=4),
    keras.layers.Dense(3, activation='softmax')
])

# Compile the model
model.compile(optimizer='adam',
              loss='sparse_categorical_crossentropy',
              metrics=['accuracy'])

# Train the model on the training data
model.fit(X_train, y_train, epochs=200, batch_size=32, verbose=0)
```

```
# Evaluate the model on the test data
y_pred = model.predict(X_test)
y_pred_classes = [tf.argmax(x).numpy() for x in y_pred]

# Generate a confusion matrix
conf_matrix = confusion_matrix(y_test, y_pred_classes)
print("Confusion Matrix:")
print(conf_matrix)

# Simulate overfitting by training for more epochs
overfit_model = keras.Sequential([
    keras.layers.Dense(64, activation='relu', input_dim=4),
    keras.layers.Dense(3, activation='softmax')
])

overfit_model.compile(optimizer='adam',
                      loss='sparse_categorical_crossentropy',
                      metrics=['accuracy'])

# Train the model on the training data for too many epochs
overfit_model.fit(X_train, y_train, epochs=1000, batch_size=32, verbose=0)

# Evaluate the overfit model on the test data
y_pred_overfit = overfit_model.predict(X_test)
y_pred_overfit_classes = [tf.argmax(x).numpy() for x in y_pred_overfit]

# Generate a confusion matrix for the overfit model
conf_matrix_overfit = confusion_matrix(y_test, y_pred_overfit_classes)

AIM : Text Classification and Word Vectors.

INPUT

```
import numpy as np
from gensim.models import Word2Vec
from sklearn.model_selection import train_test_split
from sklearn.feature_extraction.text import TfidfVectorizer
from sklearn.naive_bayes import MultinomialNB
from sklearn.metrics import accuracy_score

# Step 1: Sample data (replace with your dataset)
positive_reviews = ["This movie is fantastic!", "I loved it.", "Great film."]
negative_reviews = ["Terrible movie.", "Hated it.", "Awful film."]

# Label the data: 1 for positive and 0 for negative
labels = [1] * len(positive_reviews) + [0] * len(negative_reviews)
reviews = positive_reviews + negative_reviews

# Step 2: Load pre-trained Word2Vec embeddings
# Download pre-trained Word2Vec embeddings from a source like GloVe or Word2Vec
# In this example, we'll use dummy Word2Vec embeddings for illustration purposes.

word_vectors = {
    "this": np.array([0.1, 0.2, 0.3]),
    "movie": np.array([0.2, 0.3, 0.4]),
    "is": np.array([0.3, 0.4, 0.5]),
    "fantastic!": np.array([0.4, 0.5, 0.6]),
    "terrible": np.array([-0.3, -0.4, -0.5]),
    "hated": np.array([-0.4, -0.5, -0.6]),
}

# Step 3: Convert text data to numerical representations using word vectors
def text_to_vector(text):
    words = text.split()
    vectors = [word_vectors[word] for word in words if word in word_vectors]
    if not vectors:
        return np.zeros(3)  # Return a zero vector if no known words are present
    return np.mean(vectors, axis=0)

X = np.array([text_to_vector(review) for review in reviews])

# Step 4: Split the data and train a classification model (e.g., Naive Bayes)
X_train, X_test, y_train, y_test = train_test_split(X, labels, test_size=0.2,
random_state=42)

# Train a simple Naive Bayes classifier
```

```
classifier = MultinomialNB()
classifier.fit(X_train, y_train)

# Make predictions
y_pred = classifier.predict(X_test)

# Calculate accuracy
accuracy = accuracy_score(y_test, y_pred)
print(f"Accuracy: {accuracy}")
```

Output

```
Accuracy: 0.0
```
